

Genomes with ≥ 5 phaC copies: who, is it legitimate, and where

239 of 31,464 phaC-positive genomes (0.76%) carry ≥ 5 copies. Top 5 species account for only 17% of these -- not a small-species story. 92/239 (38%) are RSGB23-1 isolate genomes with no habitat/location.

C. Are these phaC calls legitimate?

Contamination (MAG-derived only): 2.16% mean (n=147) vs. 1.53% dataset-wide baseline (n=90,846).

Within-genome pairwise identity between a genome's own copies: median 75%, only 3% of comparable pairs

not the signature of simple assembly-duplication artifacts.

B. Where in the world (147 located genomes, RSGB23-1 excluded)
