

phaC Sequence Evidence: Identity vs. Coverage to the Audited Reference Set

33,780 of 33,780 verified phaC targets have ≥ 1 hit ($e < 1e-5$) to the 1,723-sequence audited reference set; the rest (0) have none at all.

Reference set = 1,723 phaC/FUSION references confirmed genuine by the full InterPro domain audit (PHA_CLEAN_RESULTS.md §2), not just the 14-sequence "trusted" benchmark used earlier. High identity concentrated at low coverage (bottom-right-ish) marks short, possibly-coincidental conserved-motif-only matches rather than full-length homology -- coverage matters as much as identity for judging real evidence strength.
