

Modicisalibacter zincidurans: a conserved phaC gene family across 6 independent genomes

ZHEN20-1\_SAMN07748058\_MAG\_00000118 · Halomonadaceae (same family as the commercialized PHA-production chassis Halomonas bluephagenesis) · 11.34N 142.33E, western Pacific seawater · study ZHEN20-1

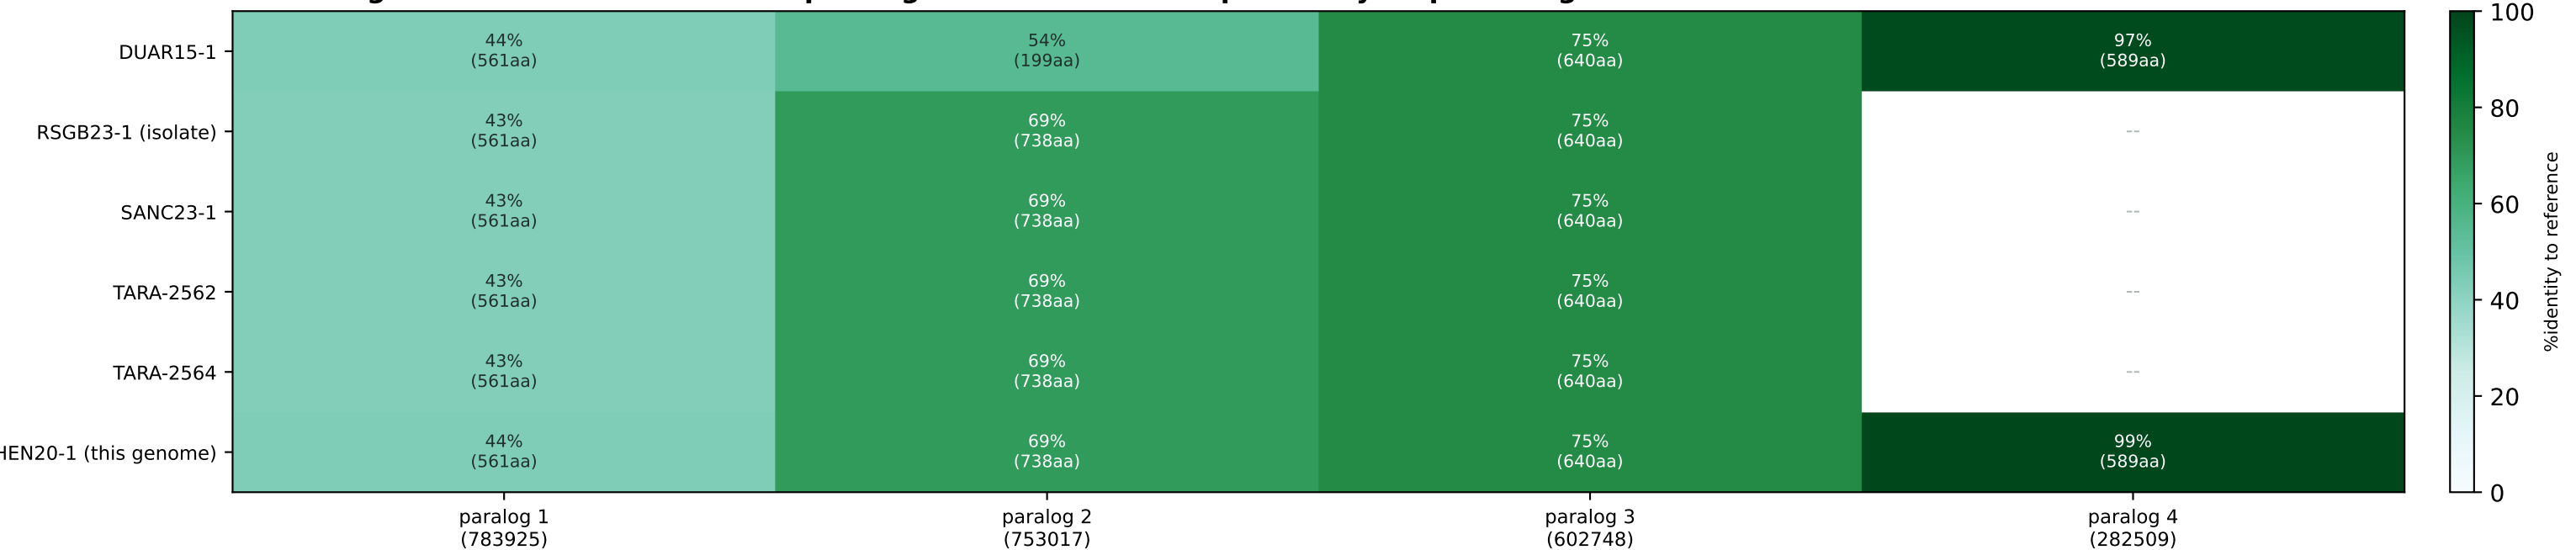

A. Paralog tree (this genome)

B. Pairwise %identity (this genome)

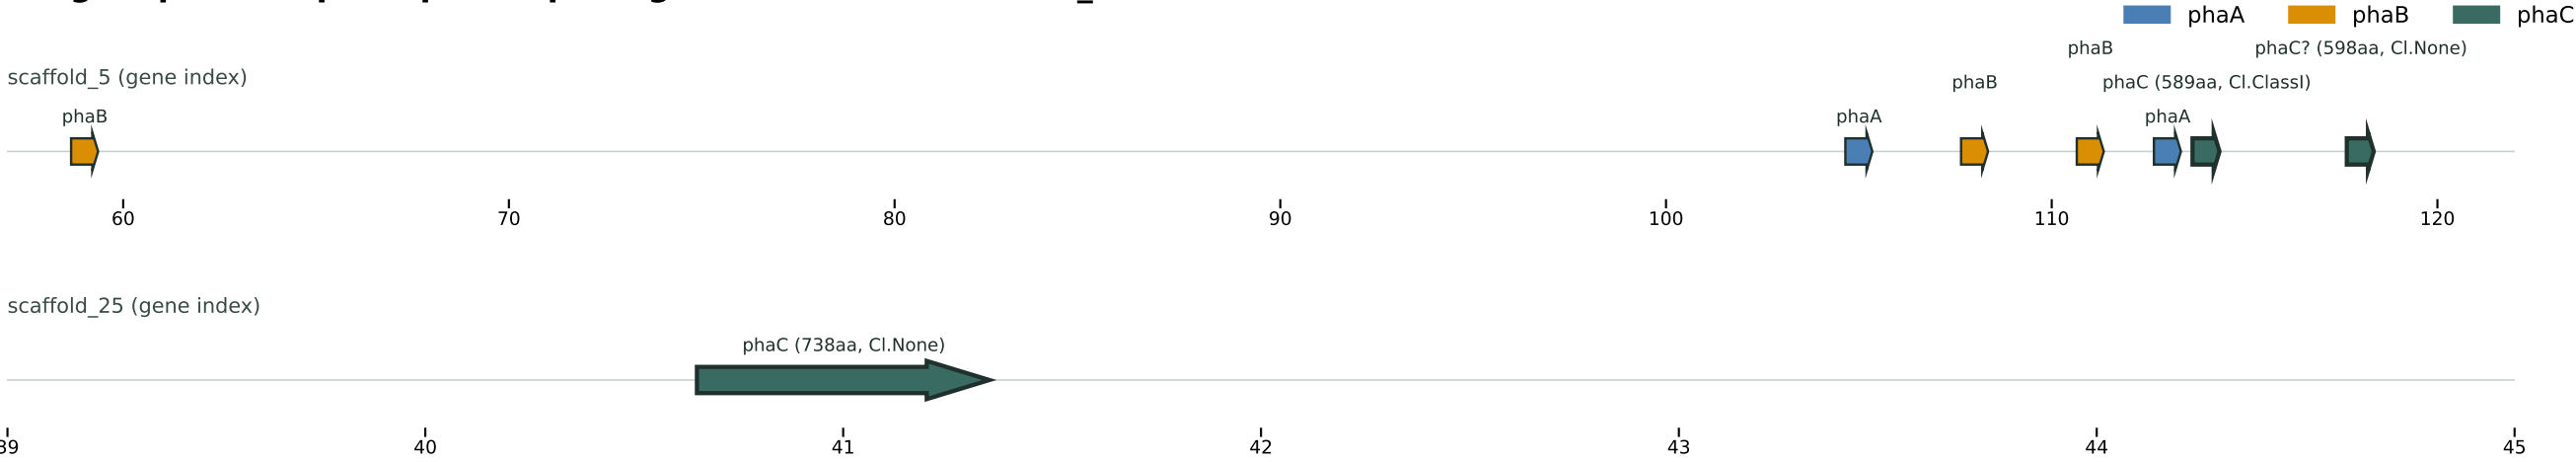

C. Cross-genome conservation: same paralogs found in all 6 independently-sequenced genomes?

5 studies, 1 NCBI isolate reference genome. "--" = this genome lacks that paralog. Paralogs 1-3 present in all 6 genomes with near-identical %identity/length each time -- a conserved species-level gene family, not noise.

D. Contig map: a real phaB-phaA...phaC gene cluster on scaffold\_5

E. Structural class: live HMM bit scores (\* = passes official trusted cutoff)
