

mcl-PHA precursor-supply route: beta-oxidation-linked (phaJ) vs. FAS-linked (phaG)

phaC-positive genomes only (n=31,464). "FAS-linked" and "Both" bars are phaG-positive; phaG is rare overall (5.5% of phaC-positive genomes) and mostly co-occurs with phaJ rather than replacing it.

A. Full pathway architecture: canonical (AB) x beta-oxidation-linked (J) x FAS-linked (G)

B. MCL precursor route by phylum (top 9)

C. MCL precursor route by habitat
