

CARD22-1 Desulfoluna MAG (Red Sea coral tissue): 7 phaC copies, one genome

CARD22-1_SAMN24292811_MAG_00000010 · 99.35% complete, 1.77% contamination · 22.18N 39.02E, Goniastrea edwardsi coral tissue · study CARD22-1

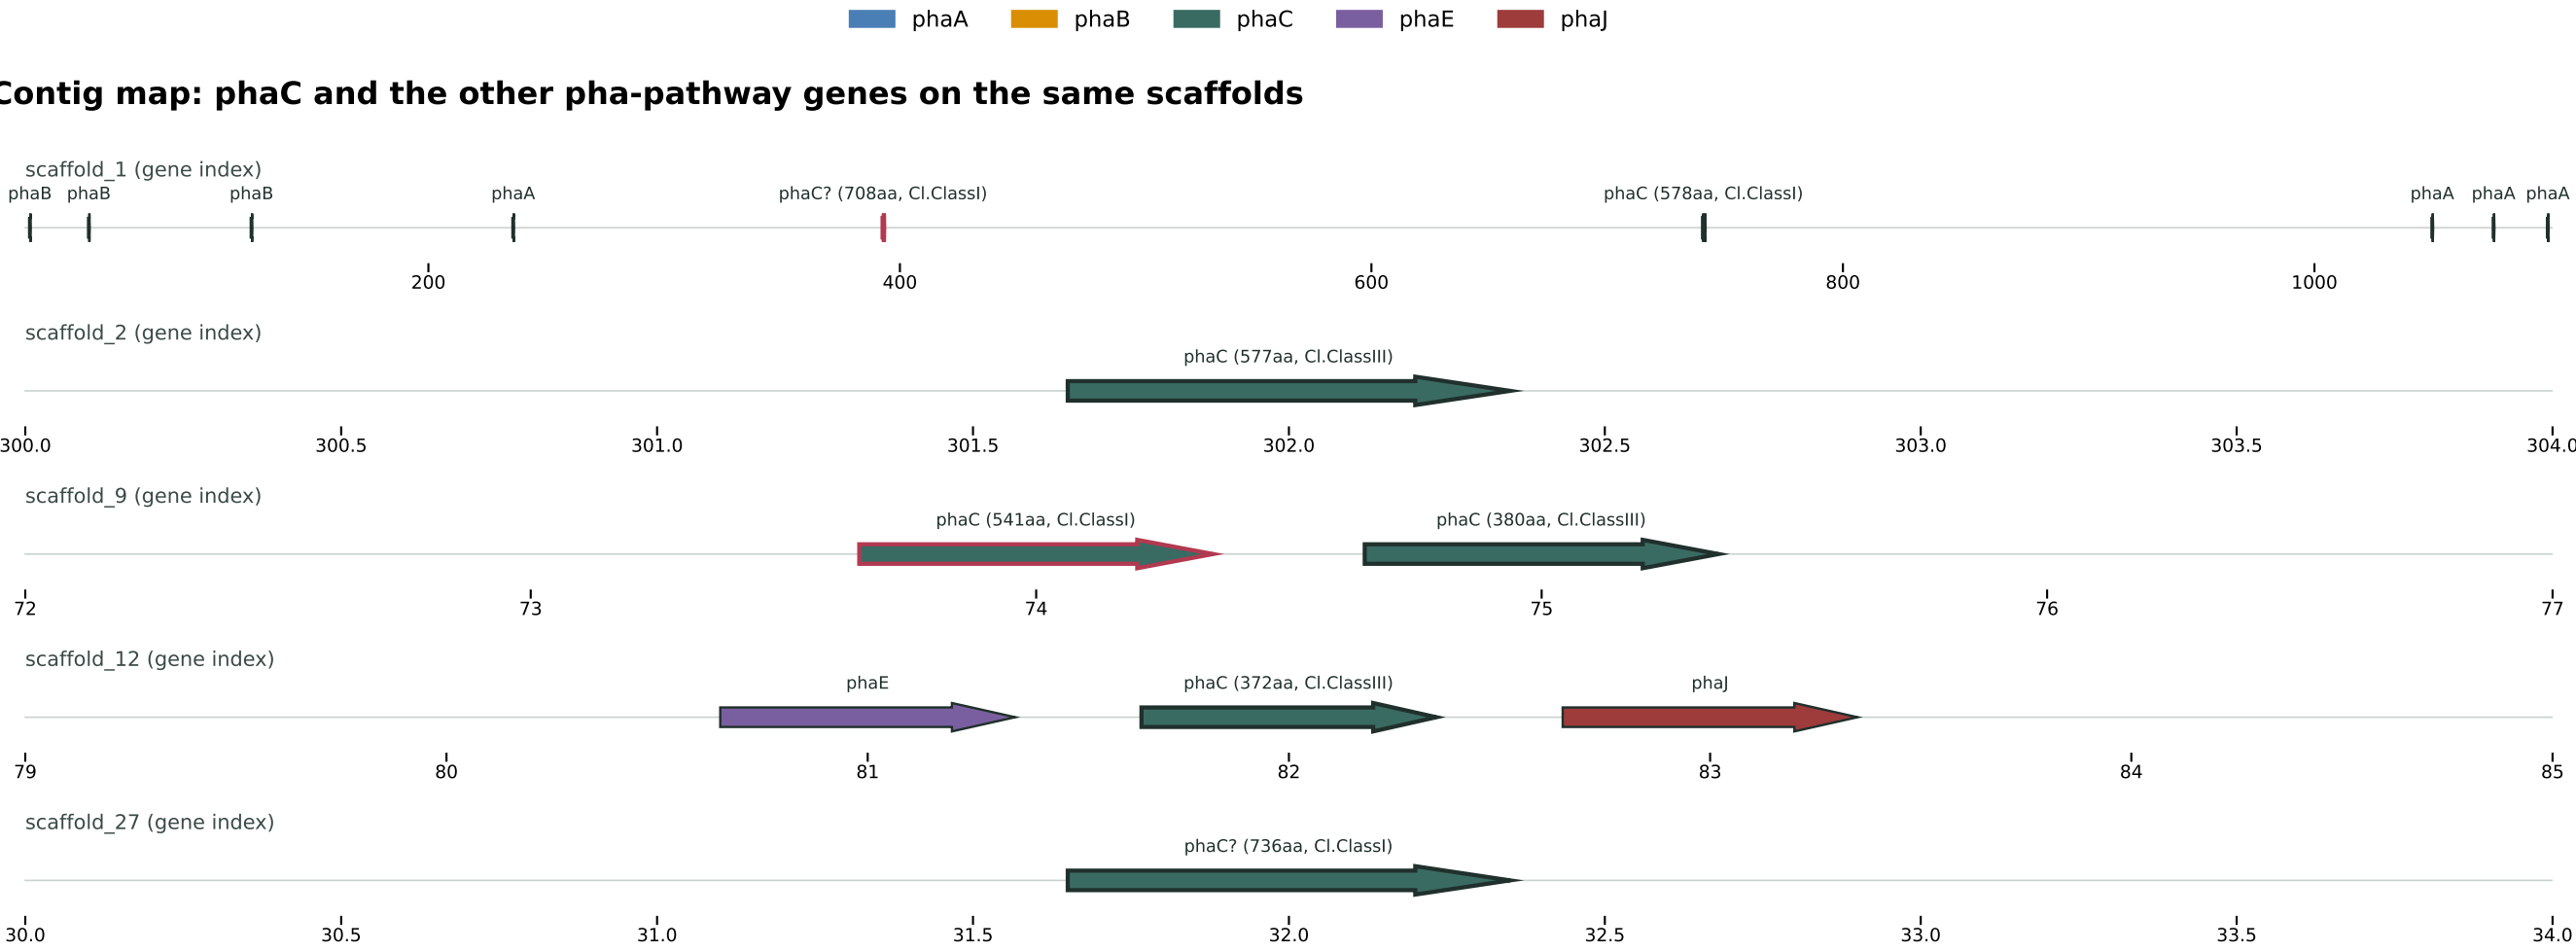

A. Paralog tree: one clade, or independent classes?

B. Pairwise %identity between all 7 copies

C. Contig map: phaC and the other pha-pathway genes on the same scaffolds

D. Structural class: live HMM bit scores per model (color = rank within column; * = passes official trusted cutoff)

184878	-	56	18	-	-	294

'phaC?' / '[phaC/Z ambiguous]' = these two copies (184878, 189118) score higher against this genome's own phaZ (depolymerase) candidates than against phaC references -- family assignment genuinely unresolved, see script docstring point 5.
