

PhaC Regional Specialists: 70%-Identity Clusters Concentrated in One Place

Selected from clusters with geo_mean_resultant_length > 0.85 (a genuinely concentrated, not cosmopolitan, footprint)
and ≥8 genomes with resolved depth — position = circular-mean centroid of member genomes

Genome
(dominant genus)

Avg. depth

 *Algiphilus*

29 m (n=15)

 *Robiginitomaculum_A*

173 m (n=16)

Circle size ~ genome count (sqrt-scaled). No two shown clusters are close enough to need this figure's leader-line overlap handling.
Average depth = mean depth_m across genomes with resolved depth (missing dropped, not imputed as zero). 9 of the original 11 hand-picked clusters were dropped (all-spurious membership, QC fix).
