

PhaC TemStaPro Stability vs. Ocean Temperature

TemStaPro class is shown as the midpoint of right_hand_label bins (<40 plotted at 37.5 deg C; >=80 at 82.5 deg C).
Points are QC-filtered with figures/scripts/_phac_qc.py to remove known mislabeled phaC reference hits, and length-filtered to >=300aa (short fragments produce unreliable, non-monotonic stability calls); black points/line mark the median pred

Rows: 128,000 TemStaPro predictions; 94,211 removed by phaC QC; 4,262 removed as <300aa fragments; 4,225 passed predictions with WOA temperature plotted.

- mesophilic (n=3,828)
- undetermined (n=156)
- thermophilic (n=228)
- hyperthermophilic (n=13)
