

phaC Genomes Whose Synthase Is Highly Divergent From the Rest of the Database

All depths, all 68,424 verified phaC-positive genomes searched -- not just the surface, not just depth-resolved ones.

Highlighted points QC-checked: query length 150-700aa and best-hit qcov/tcov ≥ 0.6 (0 candidates failed this and were dropped).
Pool excludes the 67 confirmed-wrong-gene phaC reference hits (PHAC_BAD_QUERIES) and each query's own sequence. The 222 distinct divergent target_ids do NOT cluster with each other either (222 singleton clusters under phaC_cluster0.7's own settings) -- independently divergent, not one lineage.
