

phaC Host-Specific Clusters: Phylum → Class → Order (All Phyla)

4,245 of 4,349 phaC clusters (97.6%) are found in exactly one host phylum — all 38 phyla shown, top 3 classes/phylum, top 2 orders/class, 104 leaves total

are folded into one "N smaller ..." leaf (grey) rather than omitted -- every phylum and its full cluster count is represented somewhere in the tree. Excludes 219 mislabeled phnC reference proteins (isochorismate synthase, an unrelated K+/Na+ antiporter, etc. -- see [_phac_qc.py](#)).
