

phaC Cluster ...000117564048 (Nitrosopumilus-dominant): Host Spread

713 genomes across 28 genera and 8 phyla — one dot per genus, sized by genome count

Outer colored band = phylum, matching branch/dot color. Genus-level dots are intentionally unlabeled (too many to read individually) -- this is one of the two most taxonomically promiscuous clusters in the dataset.
