

Vibrio: Does Its phaC Cluster Change With Depth?

53 Vibrio genomes with resolved depth, 2 distinct phaC clusters — one point per genome, columns sorted by median depth

Faint vertical bars show each cluster's observed depth range (min-max). A cluster confined to a narrow band at one depth suggests depth-restriction; a cluster spanning the full axis suggests it isn't depth-specific. Excludes 219 mislabeled/misannotated phaC references (see _phac_qc.py).
