

Verified phaC Genomes by Catalytic, HMM, and Pathway Evidence

All 31,464 genomes with a verified phaC hit (post reference-query audit) -- other-gene counts use the audited, corrected family assignment.

Priority order (mutually exclusive): catalytic triad > HMM support > pathway richness. Triad = Cys+Asp+His all present at the expected positions via hmmanly-align-column projection onto phaC_custom.hmm. HMM-supported = hits ≥ 1 of 6 profile HMMs. Other-gene counts exclude phaC itself and use the corrected, per-reference-audited family assignment (see PHA_ALL_FAMILIES_REFERENCE_AUDIT.md).
