

UBA868-Dominant PhaC Clusters Are Cosmopolitan, Not Regional

10 of 23 clusters with UBA868 as the dominant host genus, restricted to those with ≥ 50 genomes — each panel is one cluster's actual genome-level footprint (not a centroid). Contrast with the regional-specialist figure: those clusters had `geo_mean_resultant_length` > 0.85 (concentrated in one place); every cluster shown here has $R < 0.65$ — genuinely global, not local.
