

Taxonomy of phaC-Negative, PHA-Gene-Rich Genomes

13,522 genomes with >5 other PHA genes but no phaC hit, grouped by phylum then genus — tile area = genome count

Genera with <15 qualifying genomes are folded into one faint "N smaller genera" tile per phylum (still real genomes, just too many distinct tiny genera to label individually); phyla with <60 total are folded into "Other phyla."
